

## Part 3—Dealings that are not notifiable low risk dealings

Note 1: The following list qualifies the list in Parts 1 and 2, and is not an exhaustive list of dealings that are not notifiable low risk dealings.

Note 2: If a dealing is not a notifiable low risk dealing, or an exempt dealing, as provided by these Regulations, a person undertaking the dealing must be authorised by a GMO licence unless the dealing is within one of the other exceptions to licensing provided by the Act: see section 32 of the Act.

### 3.1 Kinds of dealings

- (1) A dealing of any of the following kinds, or involving a dealing of the following kinds, is not a notifiable low risk dealing:
  - (a) a dealing (other than a dealing mentioned in paragraph 2.1(h)) involving cloning of nucleic acid encoding a toxin having an LD<sub>50</sub> of less than 100 micrograms per kilogram;
  - (b) a dealing involving high level expression of toxin genes, even if the LD<sub>50</sub> is 100 micrograms per kilogram or more;
  - (c) a dealing (other than a dealing mentioned in paragraph 2.1(h)) involving cloning of uncharacterised nucleic acid from a toxin-producing organism;
  - (d) a dealing involving virions of a replication defective viral vector and a host not mentioned in Part 2 of Schedule 2, if:
    - (i) the donor nucleic acid confers an oncogenic modification or immunomodulatory effect in humans; and
    - (ii) the dealing is not a dealing mentioned in paragraph 2.1(i);
  - (e) a dealing involving a replication competent virus or viral vector, other than a vector mentioned in Part 2 of Schedule 2, if the genetic modification confers an oncogenic modification or immunomodulatory effect in humans;
  - (f) a dealing involving, as host or vector, a micro-organism, if:
    - (i) the micro-organism has been implicated in, or has a history of causing, disease in otherwise healthy:
      - (A) human beings; or
      - (B) animals; or
      - (C) plants; or
      - (D) fungi; and
    - (ii) none of the following sub-subparagraphs apply:
      - (A) the host/vector system is a system mentioned in Part 2 of Schedule 2;
      - (B) the genetic modification is characterised and its characterisation shows that it is unlikely to increase the capacity of the host or vector to cause harm;
      - (C) the dealing is a dealing mentioned in paragraph 2.1(g);

Example: A genetic modification would not comply with sub-subparagraph (B) if, in relation to the capacity of the host or vector to cause harm, it:

- (a) provides an advantage; or

**Schedule 3** Notifiable low risk dealings in relation to a GMO

**Part 3** Dealings that are not notifiable low risk dealings

---

- (b) adds a potential host species or mode of transmission; or
  - (c) increases its virulence, pathogenicity or transmissibility.
- (g) a dealing involving the introduction, into a micro-organism, of nucleic acid encoding a pathogenic determinant, unless:
  - (i) the dealing is a dealing mentioned in paragraph 2.1(g); or
  - (ii) the micro-organism is a host mentioned in Part 2 of Schedule 2;
- (h) a dealing involving the introduction into a micro-organism, other than a host mentioned in Part 2 of Schedule 2, of genes whose expressed products are likely to increase the capacity of the micro-organisms to induce an autoimmune response;
- (i) a dealing involving use of a viral or viroid genome, or fragments of a viral or viroid genome, to produce a novel replication competent virus with an increased capacity to cause harm compared to the capacity of the parent or donor organism;

Example: A dealing would comply with paragraph (i) if it produces a novel replication competent virus that has a higher capacity to cause harm to any potential host species than the parent organism because the new virus has:

- (a) an advantage; or
  - (b) a new potential host species or mode of transmissibility; or
  - (c) increased virulence, pathogenicity or transmissibility.
- (j) a dealing, other than a dealing mentioned in paragraph 2.1(l) or (m), with a replication defective retroviral vector (including a lentiviral vector) able to transduce human cells;
- (k) a dealing involving a genetically modified animal, plant or fungus that is capable of secreting or producing infectious agents as a result of the genetic modification;
- (l) a dealing producing, in each vessel containing the resultant GMO culture, more than 25 litres of that culture, other than a dealing mentioned in paragraph 2.1(f);
- (m) a dealing that is inconsistent with a policy principle issued by the Ministerial Council;
- (n) a dealing involving the intentional introduction of a GMO into a human being, unless the GMO:
  - (i) is a human somatic cell; and
  - (ii) cannot secrete or produce infectious agents as a result of the genetic modification; and
  - (iii) if it was generated using viral vectors:
    - (A) has been tested for the presence of viruses likely to recombine with the genetically modified nucleic acid in the somatic cells; and
    - (B) the testing did not detect a virus mentioned in sub-subparagraph (A); and
    - (C) the viral vector used to generate the GMO as part of a previous dealing is no longer present in the somatic cells;

- (o) a dealing involving a genetically modified pathogenic organism, if the practical treatment of any disease or abnormality caused by the organism would be impaired by the genetic modification;
- (p) a dealing involving a micro-organism that satisfies the criteria in AS/NZS 2243.3:2010 for classification as Risk Group 4;
- (q) a dealing involving a micro-organism that satisfies the criteria in AS/NZS 2243.3:2010 for classification as Risk Group 3 and that is not undertaken:
  - (i) in a facility that is certified by the Regulator to at least physical containment level 3 and that is appropriate for the dealing; or
  - (ii) in a facility that the Regulator has agreed in writing is a facility in which the dealing may be undertaken;
- (r) a dealing involving a GMO capable of sexual reproduction, the sexual progeny of which are, as a result of the genetic modification, more likely to inherit a particular nucleotide sequence or set of nucleotide sequences (when compared to inheritance from the unmodified parent organism);
- (s) a dealing involving a viral vector that can modify an organism capable of sexual reproduction, so that the sexual progeny of the organism are more likely to inherit a particular nucleotide sequence or set of nucleotide sequences (when compared to inheritance from the unmodified parent organism).

Note: A modification that increases the likelihood of inheritance of a nucleotide sequence or sequences, as described in paragraphs (r) and (s), is generally known as an engineered gene drive.

- (2) For the purposes of paragraph (1)(p), a genetically modified micro-organism is taken to satisfy the criteria in AS/NZS 2243.3:2010 for classification as Risk Group 4 if the unmodified parent micro-organism satisfies those criteria.
- (3) For the purposes of paragraph (1)(q), a genetically modified micro-organism is taken to satisfy the criteria in AS/NZS 2243.3:2010 for classification as Risk Group 3 if the unmodified parent micro-organism satisfies those criteria.
- (4) However, subclause (3) does not apply in relation to a replication defective retroviral vector that meets the criteria in paragraph 2.1(l) or (m).
